(54) COSMETIC COMPOSITIONS

The invention relates to a composition for 10 use in cosmeric preparations, especially cosmetic cleaning agents, containing substances for replacing the oil in the skin, based on esterification products of plycerine-ethylene oxide adducts with long-chain fatty acids.

Cosmetic cleansing agents such as shampoos, foam baths, toiler soaps and similar products cause a more or less great removal of oil from the skin on repeated use. This phenomenon is perticularly pronounced when the cleansing agents are based on synthetic, surface-active substances such as alkylbenzone sulphonerse, fatty alcohol sulphanes, olefine sulphoneres, fany alcohol other sulphares and other surfaceactive compounds. Amenipus have therefore been made to neutralise this removal of oil from the akin by replacing the oil by means of suitable additions to the cleansing agents. Allowance has in such case to be made for disadvantages, however, since the products generally concerned in replacing the oil in the skin have an unfavourable action on the foaming properties of the cleansing agons and, in commerce preparations based on alcoholwater mixtures, show insufficient solubility.

The present invention provides a composi-tion for use in cosmetic preparation which comprises a surface active compound and the esterification product of an ethylene oxide addition compound produced from glycurine and 4 to 20 mal of ethylene oxide per mol of glycerine, with a famy acid of chain length mol of fatty acid to 1 mol of glycarine-schyl-ene oxide addition compound as oil replacement material. Esterification products of ethylene oxide ad-

dition compounds produced from glycerine and 7 to 15 mol of ethylene oxide per mol of glycerine with fatty acids of chain length from 8 to 18 carbon atoms in a ratio of 1 mol of fatty said to 1 mol of glycerine-ethylene oxide addition compound are preferred as the oil replacement materials.

The preparation of the ethylane oxide addition compound as intermediate product was generally effected in known way by reacting glycerine with ethylene oxide in the desired proportions with alkaline caralysis by means of sodium ethylare. For the further treatment, the ethylene oxide addition compound obtained was reacted in the usual way with a fetty acid of chain length from 8 to 16 carbon atoms in the molar ratio of 1:1 or 1:2, using isopropyl titanate as exterification carelyst. The esterification products obtained were lightcoloured to yellowish liquids of low viscosity with an oil character to lard-like products of a faint self colour.

The quantities of oil replacement material according to the invention used in the casmetic preparations may vary within very wide limits according to the product and its oil-removing action, and generally vary from 2 to 50% by Weight, especially 5 in 25% by weight, especially 5 in 25% by weight. Still higher additions are possible fit the esterification products according to the invention are used at the same time in their property as surface-active substances, but in most cases this use will be of small advantage.

Oil replacement materials to be used according to the invention include, for example, esterification products from

from 8 to 18 carbon atoms in a ratio of 1 to 2

0.5 g/litre	260	170	300	340	240
1.0 g/litro	510	250	490	490	400
2.0 g/litre	660	330	610	640	540
Breaking down of t	he volume of	fosm in ml/min	ite		
0.5 g/litre	2.0	2.5	4.0	4.5	1.5
1.0 g/licre	5.5	3.5	7.0	8.0	4.0
2.0 g/li uc	8.0	6.5	9.5	3.0	6.5

The foaming power of the individual mix-tures was measured in the foam-bearing machine according to DIN (Deutsche Indus-trie Nurm) classification No. 53,902, in which trie Norm) classification No. 53,912, in which the volume of foam was measured. The figures for the foam were taken at 45°C in warer of 10° German hardness after 30 beats. The measurement was taken 1 minutes after the end of the beating and 21 minutes after the end of the beating. The breakdown of the volume of foam was calculated in ml/minute from the decrease of the volume of foam in

20 minutes. The amounts given in g/litre

20 minutes. The amounts given in g/litte relate to the respective mixture.

As may be seen from the above Table, the foam values of the mixtures containing oil replacement means according to the invention are substantially better than when isopropyl myristate is used as oil replacement materials, and are scarcely inferior to the figures for a mixture of pure detergent substances.

A few formulations for cosmetic preparations containing oil replacement materials according to the invention are given below.

The oll replacement compositions according to the invention can be used particularly advantageously in cosmetic cleansing means, because they do not exert any appraciable influence on the founding power of the surface-active products, and because they already have a good solubility in alcoholwater mixtures.

WHAT WR CLAIM IS:—

 A composition, for use in cosmetic preparations, which comprises a surface active compound and the exterification product of an ethylene exide addition compound produced from glycerine and 4 to 20 mol of ethylene exide per mol of glycerine with a fatty acid of

ide per mol of glycerine with a fatty acid of chain length from 8 to 18 carbon atoms in a ratio of 1 to 2 mol of fatty acid to 1 mol of glycerine-chylene oxide addition compound as oil replacement material.

 A composition according to claim 1, in which the ratio of glycerine to ethylene oxide in the addition compound is from 7 to 15 mols of ethylene oxide per mol of glycerine.

3. A composition according to claim 1 or 2 wherein the farty acids of chain length from 8 to 18 carbon atoms are in a ratio of 1 mol of fatty acid to 1 mol of the glycerine-ethylene oxide addition compound.

4 A composition according to claims 1 to 3, containing from 2 to 50% by weight of the oil replacement material.

5. A composition according to claim 1 to 4 containing from 5 to 25% by weight of the oil replacement material.

6. A composition according to claim 1 substantially as hereinbefore described with reference to and as illustrated in the foregoing examples.

7. A cosmetic preparation whenever containing a composition as claimed in any one of claims 1 to 6.

of claims 1 to 6.
